Section 3 : Short Answer

8. Explain the difference between HDD and SSD.

Ans.

Feature	HDD(Hard Disk Drive)	SSD(Solid State Drive)
Technology	Uses magnetic spinning disks and a mechanical arm to read/write data.	Uses flash memory (no moving parts) to store data.
Speed	Slower read/write speeds due to mechanical movement.	Much faster read/write speeds.
Durability	More prone to damage from drops or shocks (because of moving parts).	More durable shock-resistant since it has no moving parts.
Noise	Produces noise due to spinning disks and moving heads.	Completely silent.
Power Consumption	Uses more power (mechanical operation).	Uses less power (energy-efficient).
Cost	Cheaper per GB.	More expensive per GB.
Storage Capacity	Available in larger capacities (up to several TBs at low cost).	Typically smaller capacities at the same price point.

9. Describe the function of BIOS in a computer system.

Ans. The BIOS (Basic Input/Output System) is a critical component of a computer system that performs several foundational functions.

- Power-On Self-Test (POST) :- When the computer is powered on, the BIOS runs a POST to check the hardware components (like RAM, keyboard, and disk drives) to ensure they are functioning properly.
- Boots Process :- BIOS locates and loads the operating system from a storage device (like a hard drive or SSD) into the computer's memory (RAM). This process is called boot process.
- Hardware Initialization :- It initializes system hardware such as the CPU, memory, and peripheral devices, preparing them for operation.
- BIOS Setup Utility :- BIOS provides a configuration interface (usually accessible by pressing a key like Del, F2, or Esc during startup) where users can change system settings such as boot order, clock settings, and hardware configurations.

10. List and briefly explain three input devices commonly used with computers.

Ans. There are three input devices commonly used are :-

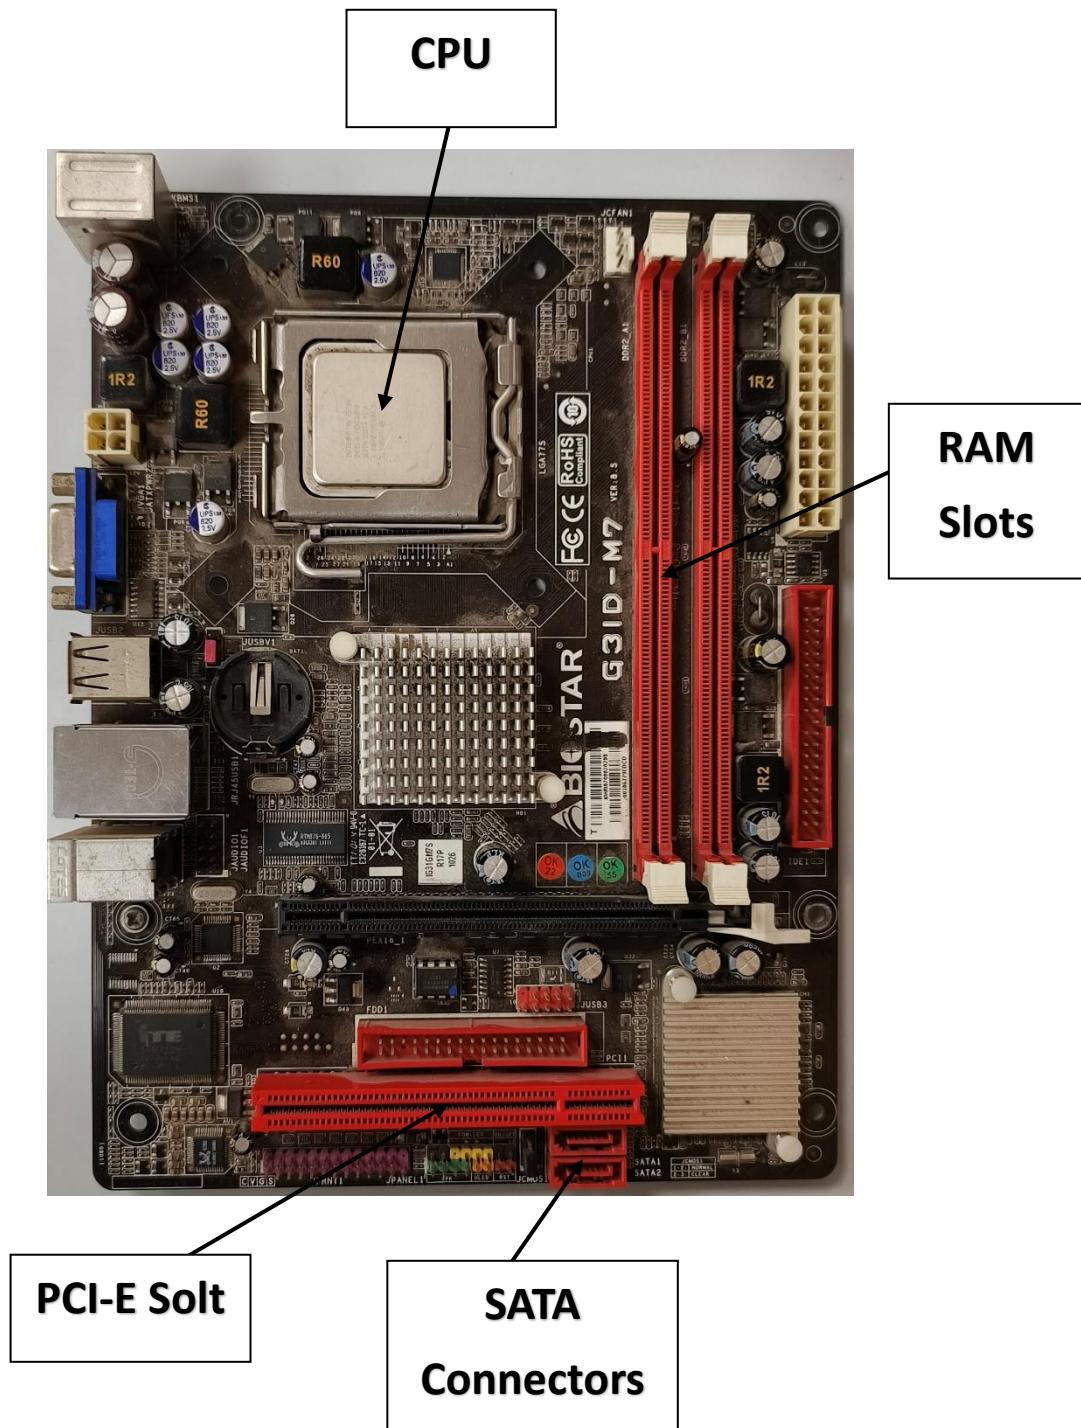

- **Keyboard** :- A keyboard is an input device that users to type text, commands, and other input into a computer. Keyboards typically have a QWERTY layout and include various keys for letters, numbers, and functions.
- **Mouse** :- A mouse is a pointing device that users to interact with graphical user interfaces (GUI). It typically has buttons for clicking and scrolling, and can be used to navigate, select, and manipulate object on the screen.
- **Touchscreen** :- A touchscreen is a display screen that responds to touch inputs, users to interact with a computer by tapping, swiping, or pinching their fingers on the screen. Touchscreens are commonly used in mobile devices, tablets, and some laptops.

Section 4 : Practical Application

11. Identify and label the following components on a diagram of a motherboard:

- CPU
- RAM Slots
- SATA Connectors
- PCI-E Slot

Ans.

12. Demonstrate how to install a RAM module into a computer.

Ans. Step-by-Step install a RAM :-

1. Power Down and Unplug the Computer

- Shut down your PC.
- Turn off the PSU switch (if applicable) and unplug the power cord.
- Press the power button once to discharge residual electricity.

2. Open the Computer Case

- Remove the side panel using a screwdriver if needed.
- Refer to your case's manual if unsure.

3. Ground Yourself

- Touch a metal part of the case or wear an anti-static wrist strap.
- This prevents damaging components with static electricity.

4. Locate the RAM Slots on the Motherboard

- Look for long slots near the CPU socket.
- These are usually labelled DIMM 1, DIMM 2, etc.

5. Prepare the RAM Slot

- Push the clips on each end of the slot outward to open them.

6. Align the RAM Module

- Match the notch on the RAM stick with the ridge in the RAM slot.
- The RAM can only fit one way due to this offset notch.

7. Insert the RAM

- Line up the RAM and press down firmly on both ends until the clips click into place.
- You may need a bit of pressure – don't be afraid, but don't force it sideways.

8. Verify Installation

- Ensure both clips are locked in.
- The RAM should sit level in the slot.

9. Reassemble and Boot

- Put the side panel back on.
- Plug the power back in and boot your PC.

10. Check System Recognizes RAM

- On Windows: Right-click This PC > Properties
Look at the Installed RAM section.
- Or enter BIOS/UEFI to confirm.
